USB regulator accepts DC input from 5.5V to 12.5V.
Efficiency above 0.3A is >95.5% at 5.5V input, >91.5% across all inputs.
Power dissipation is 1.1W, worst case (12.5V in, 4.0A out).
IC dissipation is 0.8W worst case (12.5V in, 4.0A out).

USB regulator is on whenever DC power is attached.

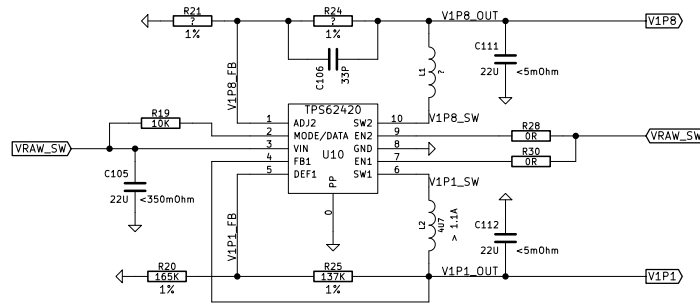

USB power switches must be held off when front end is powered down.

Regulator supplies power to main board (up to 5V@2A), if the main board doesn't have an overriding power source attached.

If DC power isn't attached to front end, only this regulator and the USB switches will not function.

USB 3.0 supply
Requirements:
3.3V output; 8mA (26mW) typical
Input: 8mA typical (36mW at 5V in)

USB 3.0 internal supply
Requirements:
1.8V output: 228mA (410mW) typical
1.1V output: 593mA (432mW) typical
Input: 936mW typical (222mA at 4.2V in, 90% efficiency)
